

The First and Only FDA-Approved Treatment of Agitation Associated with Dementia due to Alzheimer's Disease

Limitations of Use: REXULTI is not indicated as an as needed (“prn”) treatment for agitation associated with dementia due to Alzheimer’s disease

Meet Patricia, 76, a patient struggling with agitation associated with dementia due to Alzheimer’s disease who lives with her daughter and primary caregiver Rachel, and Rachel’s family^a

CURRENT PRESENTATION

- Alzheimer’s dementia (diagnosed 3 years ago); taking cholinesterase inhibitor
- Mini-Mental State Exam=21 (consistent with last visit)

CAREGIVER REPORTED RECENT AGITATION SYMPTOMS

- Occasional screaming (**aggressive**)
- General restlessness (**physically non-aggressive**)
- Repeatedly asking for attention (**verbally agitated**)

“ My mother is getting angry and frustrated more often. And now she’s restless, and even wandering. I’m at a loss for how to help her. ”

—Rachel, caregiver

^aHypothetical patient and caregiver

INDICATION

REXULTI is indicated for treatment of agitation associated with dementia due to Alzheimer’s disease.

Limitations of Use: REXULTI is not indicated as an as needed (“prn”) treatment for agitation associated with dementia due to Alzheimer’s disease

WARNING: INCREASED MORTALITY IN ELDERLY PATIENTS WITH DEMENTIA-RELATED PSYCHOSIS

Elderly patients with dementia-related psychosis treated with antipsychotic drugs are at increased risk of death. REXULTI is not approved for the treatment of patients with dementia-related psychosis without agitation associated with dementia due to Alzheimer’s disease.

Please see **IMPORTANT SAFETY INFORMATION** on pages 6 and 7.

REXULTI® (brexpiprazole): Proven to reduce the FREQUENCY of agitation symptoms

Study 7: Patients in the REXULTI 2 mg/day or 3 mg/day arm experienced a 31% greater reduction from baseline in CMAI total score vs placebo¹

STUDY 6 AND 7 DESIGN AND EFFICACY SUMMARY

REXULTI was studied in 2 Phase III, 12-week, randomized, double-blind, placebo-controlled, fixed-dose pivotal trials evaluating frequency of agitation symptoms and safety profile in patients with dementia due to Alzheimer’s disease. After a screening phase of 6 weeks, patients titrated for 2 to 4 weeks to their assigned dose.^{2,3}

Primary endpoint was change in agitation symptom frequency (CMAI total score) from baseline at Week 12 in both studies.

Study 6 and 7 Results:

	Treatment group	Mean Baseline Score	Mean Change	Treatment Difference	P-Value
Study 6	REXULTI 1 mg/day (n=134)	70.5	-17.6	0.2	P=0.90 ²
	REXULTI 2 mg/day ^a (n=138)	71.0	-21.6	-3.8	P=0.040 ²
	Placebo (n=131)	72.2	-17.8	—	—
Study 7	REXULTI 2 or 3 mg/day ^a (n=225)	80.6	-22.6	-5.3	P=0.0026 ³
	Placebo (n=116)	79.2	-17.3	—	—

^aDosages statistically significantly superior to placebo. CMAI, Cohen-Mansfield Agitation Inventory.

Go to: [Agitated behaviors as defined by CMAI](#) [Full Study Design](#)

Contraindication

In patients with known hypersensitivity to brexpiprazole or any of its components. Reactions have included: rash, facial swelling, urticaria and anaphylaxis.

Please see **IMPORTANT SAFETY INFORMATION** on pages 6 and 7.

REXULTI® (brexpiprazole): Change in frequency across subscales of agitation symptoms

REXULTI was approved for the treatment of agitation associated with dementia due to Alzheimer's disease based on the primary endpoint, change in CMAI total score from baseline at Week 12.

A secondary endpoint was the change from baseline at Week 12 in CMAI subscale scores.

Study 7: Mean change in CMAI subscales^{3,a}

Study 6: Mean change in CMAI subscales^{4,a}

^aIn a supplementary analysis to examine the magnitude and direction of CMAI subscale response, Factor 1 (aggressive behavior), Factor 2 (physically non-aggressive behavior), and Factor 3 (verbal agitation) scores trended in the same direction with no single factor overly influencing the CMAI total score.

CMAI, Cohen-Mansfield Agitation Inventory.

Important Warning and Precaution for Cerebrovascular Adverse Events, Including Stroke

In clinical trials, elderly patients with dementia randomized to risperidone, aripiprazole, and olanzapine had a higher incidence of stroke and transient ischemic attack, including fatal stroke. REXULTI is not approved for the treatment of patients with dementia-related psychosis without agitation associated with dementia due to Alzheimer's disease.

Please see **IMPORTANT SAFETY INFORMATION** on pages 6 and 7.

REXULTI® (brexpiprazole): Demonstrated safety profile

Adverse reactions in ≥2% of patients treated with REXULTI and greater than placebo from two 12-week pivotal trials across all doses

	REXULTI 1 mg/day ^a (n=137)	REXULTI 2 mg/day (n=213)	REXULTI 3 mg/day (n=153)	ALL REXULTI (n=503)	Placebo (n=251)
Infections and Infestations					
Nasopharyngitis	4%	2%	3%	3%	2%
Urinary Tract Infection	2%	3%	3%	3%	1%
Nervous System Disorders					
Dizziness ^b	1%	5%	3%	3%	2%
Headache	9%	9%	7%	8%	8%
Somnolence ^c	2%	3%	4%	3%	1%
Psychiatric Disorder					
Insomnia ^d	5%	5%	2%	4%	3%

^a1 mg once a day REXULTI dosage is not a recommended dosage for the treatment of agitation associated with dementia due to Alzheimer's disease.

^bDizziness and Vertigo are grouped to Dizziness

^cSedation and somnolence are grouped to somnolence.

^dInitial insomnia and insomnia are grouped to insomnia

Most common adverse reaction occurring in ≥4% of patients and at least twice the rate of placebo were nasopharyngitis and dizziness.

At a dose 4 times the MRHD for the treatment of agitation associated with dementia due to Alzheimer's disease, REXULTI does not prolong the **QTc interval** to any clinically relevant extent.

REXULTI vs placebo: Similar discontinuation rates due to adverse reactions from two 12-week pivotal trials across all doses

Approximately 95% of patients remained on treatment without discontinuation due to adverse reactions, whether treated with REXULTI or placebo.

MRHD, Maximum Recommended Human Dose.

Important Warning and Precaution for Neuroleptic Malignant Syndrome (NMS)

NMS is a potentially fatal symptom complex reported in association with administration of antipsychotic drugs, including REXULTI. Clinical signs of NMS are hyperpyrexia, muscle rigidity, altered mental status, and evidence of autonomic instability (irregular pulse or blood pressure, tachycardia, diaphoresis and cardiac dysrhythmia). Additional signs may include elevated creatinine phosphokinase, myoglobinuria (rhabdomyolysis), and acute renal failure. Manage NMS with immediate discontinuation of REXULTI, intensive symptomatic treatment, and monitoring.

Please see **IMPORTANT SAFETY INFORMATION** on pages 6 and 7.

REXULTI® (brexpiprazole): Low starting dose and 2- to 4-week titration schedule

Once-daily dosing

DAYS 1-7	8-14	15-28	29+
STARTING		RECOMMENDED TARGET	RECOMMENDED TARGET
0.5 mg/day	1 mg/day	2 mg/day	2 mg/day
			
			OR If clinically warranted →
			3 mg/day
			

Pills not actual size

- After at least 14 days on 2 mg/day (target dose), dosage can be increased to 3 mg/day (maximum dose), based on clinical response and tolerability
- With or without food

Dose adjustments for REXULTI

- Dose adjustments may be needed in patients with hepatic or renal impairment
- Administer half the dose of REXULTI when taken with strong CYP3A4 inhibitors or in patients who are known CYP2D6 poor metabolizers
- Administer a quarter of the dose with the concurrent use of both strong/moderate CYP2D6 inhibitors and strong/moderate CYP3A4 inhibitors. Likewise, administer a quarter of the dose in patients who are known CYP2D6 poor metabolizers taking strong/moderate CYP3A4 inhibitors
- Double the dose over 1 to 2 weeks when administering with strong CYP3A4 inducers

Sample starter packs are available^a for your appropriate patients

^aSample packs are not for sale or reimbursement.

- 14-day titration pack:**
 - 7 days at 0.5 mg/day and 7 days at 1 mg/day
- 7-day single-dose packs:**
 - 0.5 mg, 1 mg, 2 mg, 3 mg

IMPORTANT SAFETY INFORMATION for REXULTI® (brexpiprazole)

WARNING: INCREASED MORTALITY IN ELDERLY PATIENTS WITH DEMENTIA-RELATED PSYCHOSIS

Elderly patients with dementia-related psychosis treated with antipsychotic drugs are at increased risk of death. REXULTI is not approved for the treatment of patients with dementia-related psychosis without agitation associated with dementia due to Alzheimer's disease.

Contraindication: In patients with known hypersensitivity to brexpiprazole or any of its components. Reactions have included: rash, facial swelling, urticaria and anaphylaxis.

Cerebrovascular Adverse Events, Including Stroke: In clinical trials, elderly patients with dementia randomized to risperidone, aripiprazole, and olanzapine had a higher incidence of stroke and transient ischemic attack, including fatal stroke. REXULTI is not approved for the treatment of patients with dementia-related psychosis without agitation associated with dementia due to Alzheimer's disease.

Neuroleptic Malignant Syndrome (NMS): NMS is a potentially fatal symptom complex reported in association with administration of antipsychotic drugs, including REXULTI. Clinical signs of NMS are hyperpyrexia, muscle rigidity, altered mental status, and evidence of autonomic instability (irregular pulse or blood pressure, tachycardia, diaphoresis and cardiac dysrhythmia). Additional signs may include elevated creatinine phosphokinase, myoglobinuria (rhabdomyolysis), and acute renal failure. Manage NMS with immediate discontinuation of REXULTI, intensive symptomatic treatment, and monitoring.

Tardive Dyskinesia (TD): Risk of TD, and the potential to become irreversible, appear to increase with duration of treatment and total cumulative dose of antipsychotic drugs. TD can develop after relatively brief treatment periods, at low doses, or after discontinuation of treatment. For chronic treatment, use the lowest dose and shortest duration of REXULTI needed to produce a clinical response. If signs and symptoms of TD appear, drug discontinuation should be considered.

Metabolic Changes: Atypical antipsychotic drugs, including REXULTI, have caused metabolic changes including:

- **Hyperglycemia/Diabetes Mellitus:** Hyperglycemia and diabetes mellitus, in some cases extreme and associated with diabetic ketoacidosis, hyperosmolar coma or death, have been reported in patients treated with atypical antipsychotics. Assess fasting plasma glucose before or soon after initiation of antipsychotic medication and monitor periodically during long-term treatment.
- **Dyslipidemia:** Atypical antipsychotics cause adverse alterations in lipids. Before or soon after initiation of antipsychotic medication, obtain a fasting lipid profile at baseline and monitor periodically during treatment.
- **Weight Gain:** Weight gain has been observed in patients treated with REXULTI. Monitor weight at baseline and frequently thereafter.

Pathological Gambling and Other Compulsive Behaviors: Intense urges, particularly for gambling, and the inability to control these urges have been reported while taking REXULTI. Other compulsive urges have been reported less frequently. Prescribers should ask patients or their caregivers about the development of new or intense compulsive urges. Consider dose reduction or stopping REXULTI if such urges develop.

Leukopenia, Neutropenia, and Agranulocytosis: Leukopenia and neutropenia have been reported with antipsychotics. Agranulocytosis (including fatal cases) has been reported with other agents in this class. Monitor complete blood count in patients with pre-existing low white blood cell count (WBC)/absolute neutrophil count or history of drug-induced leukopenia/neutropenia. Discontinue REXULTI at the first sign of a clinically significant decline in WBC and in patients with severe neutropenia.

(continued)

Please see [FULL PRESCRIBING INFORMATION](#), including **BOXED WARNING**.

IMPORTANT SAFETY INFORMATION

for REXULTI® (brexpiprazole) (continued)

Orthostatic Hypotension and Syncope: Atypical antipsychotics cause orthostatic hypotension and syncope. Generally, the risk is greatest during initial dose titration and when increasing the dose. Monitor in patients vulnerable to hypotension, and those with cardiovascular and cerebrovascular diseases.

Falls: Antipsychotics may cause somnolence, postural hypotension, motor, and sensory instability, which may lead to falls causing fractures or other injuries. For patients with diseases, conditions, or medications that could exacerbate these effects, complete fall risk assessments when initiating treatment and recurrently during therapy.

Seizures: REXULTI may cause seizures and should be used with caution in patients with a history of seizures or with conditions that lower the seizure threshold.

Body Temperature Dysregulation: Use REXULTI with caution in patients who may experience conditions that increase body temperature (e.g., strenuous exercise, extreme heat, dehydration, or concomitant use with anticholinergics).

Dysphagia: Esophageal dysmotility and aspiration have been associated with antipsychotics, including REXULTI, and should be used with caution in patients at risk for aspiration.

Potential for Cognitive and Motor Impairment: REXULTI has the potential to impair judgment, thinking, or motor skills. Patients should be cautioned about operating hazardous machinery, including operating motor vehicles, until they are reasonably certain REXULTI does not affect them adversely.

Concomitant Medication: Dosage adjustments are recommended in patients who are known cytochrome P450 (CYP) 2D6 poor metabolizers and in patients taking concomitant CYP3A4 inhibitors or CYP2D6 inhibitors or strong CYP3A4 inducers.

Most commonly observed adverse reactions: In clinical trials of adults, the most common adverse reactions were:

- **Agitation associated with dementia due to Alzheimer's disease** ($\geq 4\%$ incidence and at least twice the rate of placebo for REXULTI vs. placebo): nasopharyngitis and dizziness.

Dystonia: Symptoms of dystonia may occur in susceptible individuals during the first days of treatment and at low doses.

Pregnancy: Adequate and well-controlled studies to assess the risks of REXULTI during pregnancy have not been conducted. REXULTI should be used during pregnancy only if the benefit justifies the risk to the fetus.

Lactation: It is not known if REXULTI is excreted in human breast milk. A decision should be made whether to discontinue nursing or to discontinue the drug, taking into account the importance of the drug to the mother.

To report SUSPECTED ADVERSE REACTIONS, contact Otsuka America Pharmaceutical, Inc. at 1-800-438-9927 or FDA at 1-800-FDA-1088 (www.fda.gov/medwatch).

Please see [FULL PRESCRIBING INFORMATION](#), including **BOXED WARNING**.

The First and Only FDA-Approved Treatment of Agitation Associated with Dementia due to Alzheimer's Disease

Hypothetical patient and caregiver

31% ↓ GREATER REDUCTION FROM BASELINE IN FREQUENCY OF AGITATION SYMPTOMS VS PLACEBO¹

REXULTI® (brexpiprazole) was studied in 2 Phase III, 12-week, randomized, double-blind, placebo-controlled, fixed-dose pivotal trials evaluating frequency of agitation symptoms and safety profile in patients with dementia due to Alzheimer's disease.

The primary endpoint was change in agitation symptom frequency (CMAI total score) from baseline at Week 12 in both studies.

31% greater reduction from baseline in CMAI total score vs placebo (mean change -22.6 vs -17.3) in patients from Study 7 in the REXULTI 2 mg/day or 3 mg/day arm.¹

DEMONSTRATED SAFETY PROFILE

- Adverse reactions $\geq 2\%$ and greater than placebo: nasopharyngitis, urinary tract infection, dizziness, headache, somnolence, insomnia
- Discontinuation rates due to adverse reactions were 5.6% (n=28/503) with REXULTI and 4.8% (n=12/251) with placebo
 - ~95% of patients remained on treatment with REXULTI without discontinuation due to adverse reactions (similar to placebo)

ONCE-DAILY TREATMENT

- Low starting dose** and a **2- to 4-week titration schedule** with a recommended **target dose of 2 mg/day**
- If clinically warranted, titration can extend to a recommended maximum dose of 3 mg/day

REXULTI has been **prescribed 6 million times since initial FDA approval** in 2015.⁵ **100% of patients on Medicare Part D** and **97% of patients nationally** have coverage for REXULTI.^{6,a}

^aAcross all channels: Commercial, Medicare Part D, and Medicaid.

Start REXULTI today for your appropriate patients

For more information on Medicare, Medicaid, coverage, and how to access REXULTI, scan this QR code or visit [REXULTI.com/savings-cost](https://www.rexulti.com/savings-cost).

INDICATION

REXULTI is indicated for treatment of agitation associated with dementia due to Alzheimer's disease.

Limitations of Use: REXULTI is not indicated as an as needed ("prn") treatment for agitation associated with dementia due to Alzheimer's disease

WARNING: INCREASED MORTALITY IN ELDERLY PATIENTS WITH DEMENTIA-RELATED PSYCHOSIS

Elderly patients with dementia-related psychosis treated with antipsychotic drugs are at increased risk of death. REXULTI is not approved for the treatment of patients with dementia-related psychosis without agitation associated with dementia due to Alzheimer's disease.

Please see **IMPORTANT SAFETY INFORMATION** on pages 6 and 7.

Agitated behaviors as defined by CMAI

The Cohen-Mansfield Agitation Inventory (CMAI) is a clinically validated scale measuring the frequency of 29 agitated behaviors.

- Grouped into 3 subscales
- Scored by clinicians based on caregiver input

Aggressive

- Screaming
- Biting
- Hitting
- Kicking
- Hurting self or others
- Cursing or verbal aggression
- Pushing
- Scratching
- Throwing things
- Spitting
- Tearing things/destroying property
- Grabbing onto people

Physically Non-aggressive

- Pacing, aimless wandering
- General restlessness
- Inappropriate dress or disrobing
- Trying to get to a different place
- Handling things inappropriately
- Performing repetitive mannerisms

Verbally Agitated

- Complaining
- Constant unwarranted request for attention or help
- Repetitive sentences or questions
- Negativism

Additional behaviors assessed by CMAI total score that often have low rates of occurrence include making physical sexual advances, intentional falling, eating/drinking inappropriate substances, hiding things, hoarding things, making verbal sexual advances, and strange noises (weird laughter or crying).^{7,8}

Scoring CMAI⁷

- Each of these 29 agitated behaviors is assigned a frequency score based on its frequency through the preceding 2 weeks
- The sum of each agitated behavior's frequency score creates a CMAI total score
- A negative change in score indicates improvement

REXULTI® (brexpiprazole) pivotal trials

Two Phase III, 12-week, randomized, double-blind, placebo-controlled, fixed-dose studies evaluated frequency (CMAI total score) of agitation symptoms in patients with dementia due to Alzheimer's disease^{2,3}

Study 6: Evaluated REXULTI 1 mg/day (n=134) or 2 mg/day (n=138), or placebo (n=131). Titration began at 0.25 mg/day for Days 1–3, then increased to 0.5 mg/day at Days 4–14, 1 mg/day at Days 15–28, and maintained at either 1 or 2 mg/day from Day 29 onward depending on assigned dose.²

Study 7: Evaluated REXULTI 2 mg/day or 3 mg/day (n=228), or placebo (n=117). Titration began at 0.5 mg/day for Days 1–7, then increased to 1 mg/day at Days 8–14, 2 mg/day at Days 15–28, and either maintained at 2 mg/day or increased to 3 mg/day from Day 29 onward.³

Key Inclusion Criteria^{2,3}

- Probable Alzheimer's disease diagnosis as per NINCDS-ADRDA Criteria
- Agitation as determined by NPI NH A/A score ≥ 4
- MMSE: ≥ 5 and ≤ 22
- Exhibit sufficient agitation behaviors at time of entry to warrant use of pharmacotherapy, after excluding other factors

Additional inclusion criteria in Study 7

- Met provisional IPA criteria for agitation associated with Alzheimer's dementia
- Aggressive agitation at baseline (≥ 1 CMAI Factor 1 behavior)

Concomitant Medications

- Cholinesterase inhibitors, memantine, and other cognitive enhancers, as well as antidepressants (like SSRI or SNRI), were permitted for the duration of the studies

EFFICACY ASSESSMENTS

PRIMARY ENDPOINT

Primary endpoint was change in agitation symptom frequency (CMAI total score) from baseline at Week 12 in both studies.

Baseline Characteristics^{2,3}

		Age (mean in years)	Gender (% female)	CMAI total score (mean)	MMSE score (% of patients)		
					Mild (>18)	Moderate (13-18)	Severe (≤ 12)
Study 6	REXULTI 1 mg/day (n=137)	74	57%	70.7	5.1%	55.5%	39.4%
	REXULTI 2 mg/day (n=140)	74	56%	71.0	7.9%	62.1%	30.0%
	Placebo (n=136)	74	52%	72.0	14.0%	54.4%	31.6%
Study 7	REXULTI 2 and 3 mg/day (n=228)	75	59%	80.4	23.2%	55.7%	21.1%
	Placebo (n=117)	73	51%	79.4	23.9%	56.4%	19.7%

CMAI, Cohen-Mansfield Agitation Inventory; IPA, International Psychogeriatric Association; MMSE, Mini-Mental State Examination; NINCDS-ADRDA, National Institute of Neurological and Communicative Diseases and Stroke/Alzheimer's Disease and Related Disorders Association; NPI NH A/A, Neuropsychiatric Inventory – Nursing Home version, Agitation/aggression domain; SNRI, serotonin and norepinephrine reuptake inhibitor; SSRI, selective serotonin reuptake inhibitor.

Go to: [Efficacy Data](#)

Contraindication

In patients with known hypersensitivity to brexpiprazole or any of its components. Reactions have included: rash, facial swelling, urticaria and anaphylaxis.

Please see **IMPORTANT SAFETY INFORMATION** on pages 6 and 7.
